CLUBINS · PRE-SEED

Every seat has a margin.

Clubins turns sound, occupancy and environment into live operational data for bars and clubs — so staffing, pricing and energy follow the room.

The subscription pays for itself:

€149 / venue / month — about one bar shift.

PROBLEM — 01

Venues run the night on gut feeling.

The decisions that decide the margin are made without data.

01 **Staffing**

The rota is written days ahead. The room changes by the hour.

02 **Pricing**

Door, bar and minimum-spend calls ride on habit and vibe.

03 **Air & energy**

Ventilation runs on timers; people arrive when they arrive.

Median German live-music venue: €240,000 turnover · €8,000 profit / year

Initiative Musik Club Study (2019), via miz.org

PROBLEM — 02

Margin leaks are invisible until month-end.

Overstaffed dead hours

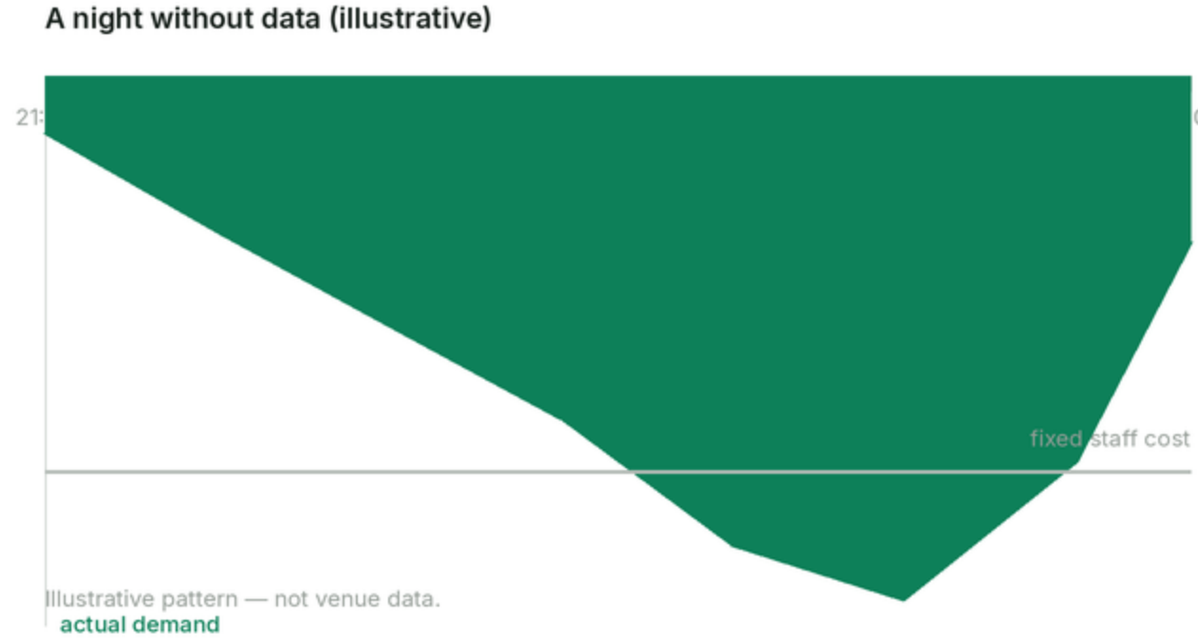

Paid hours where the room never filled.

Energy in empty rooms

Cooling and extraction run for nobody.

Noise complaints escalate

Resident conflict becomes displacement risk — the documented closure path (LiveKomm Red List).

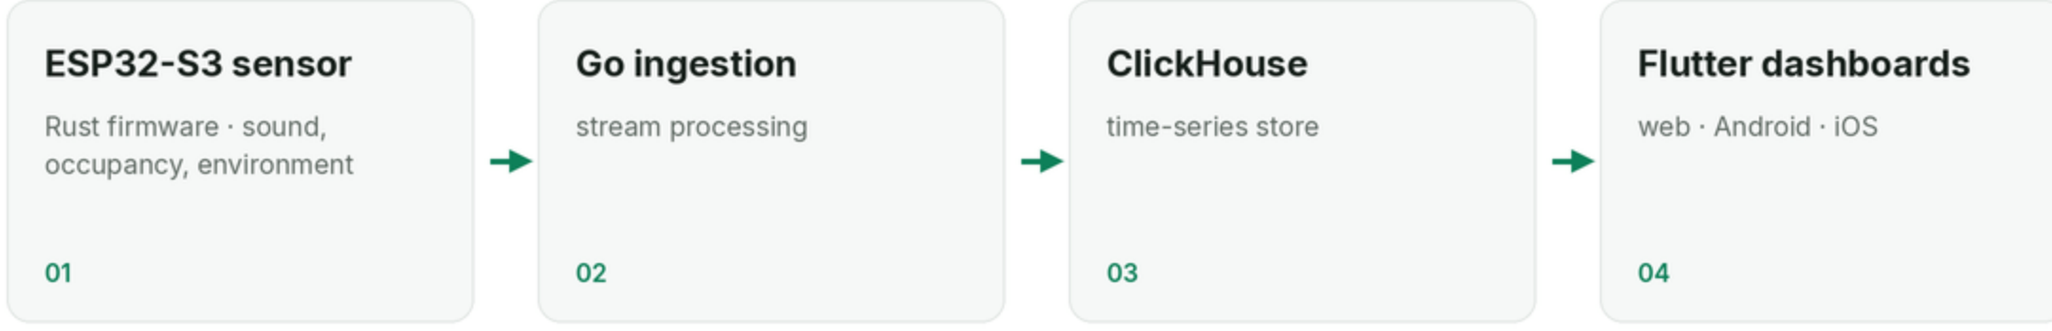

No verified national closure count exists — displacement risk is documented, not statistically claimed.

SOLUTION

Measure live. See it. Act on it.

Every decision gets a live number — during the shift, not at month-end.

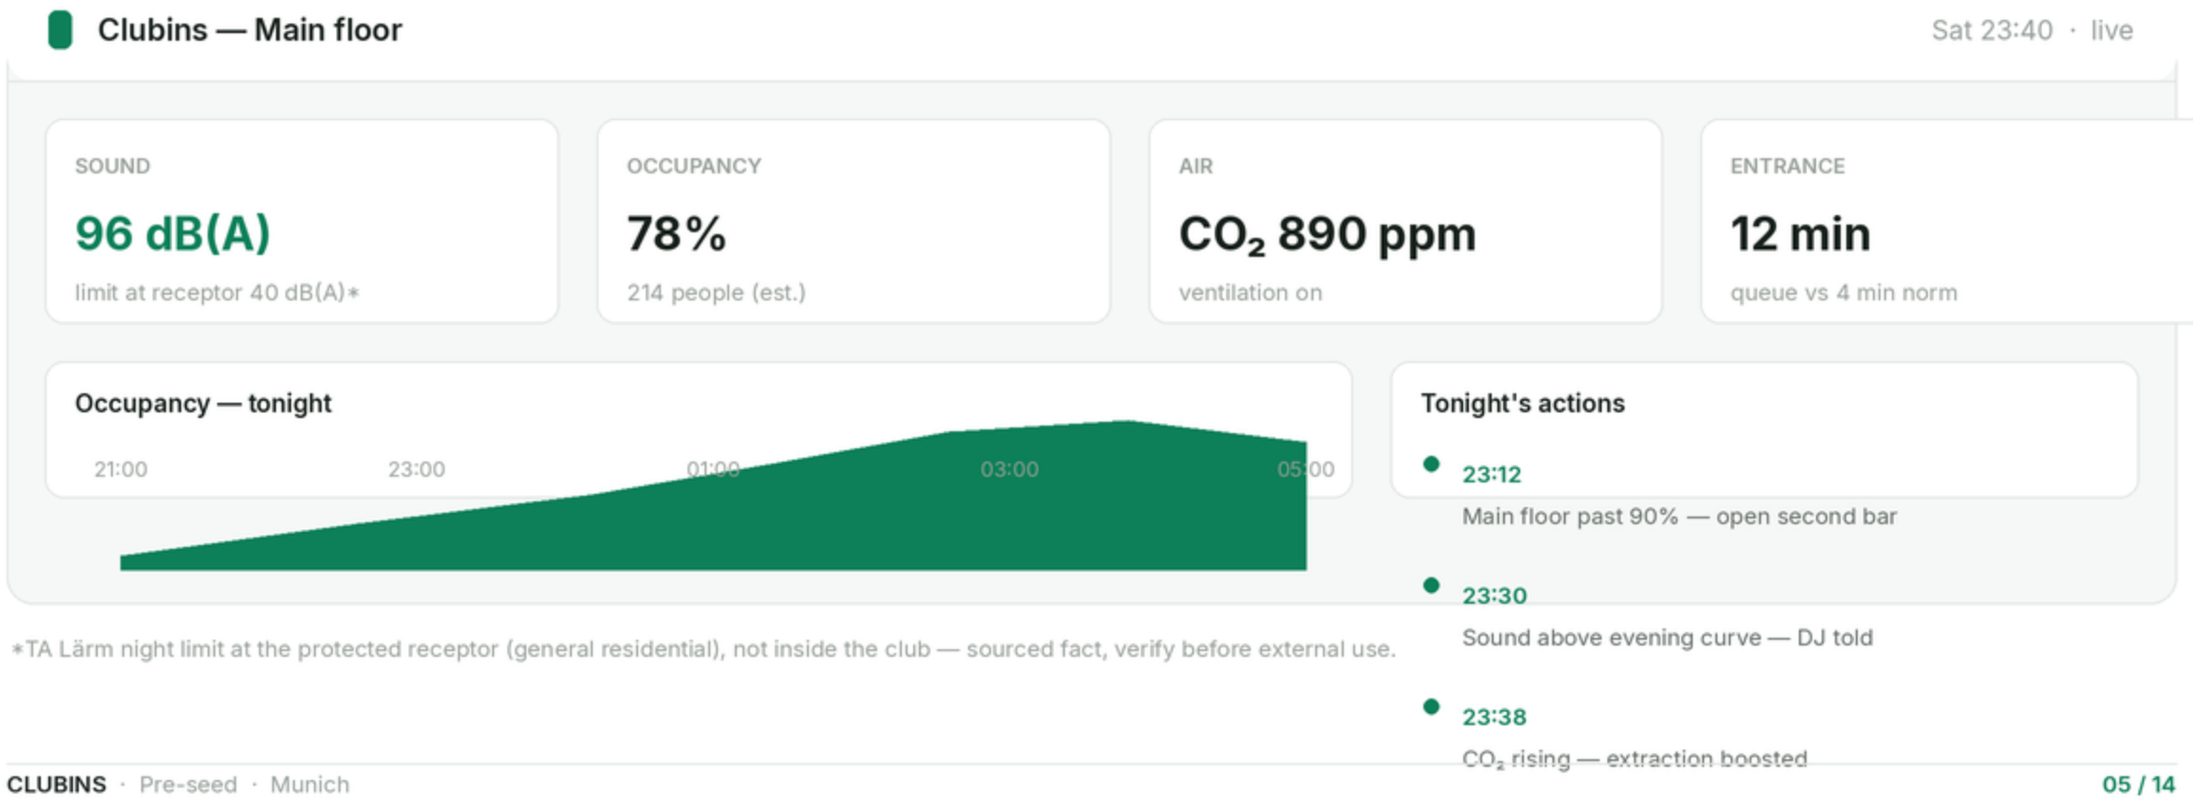

Live today: full stack validated end-to-end (October 2026).

Runs on our own NixOS infrastructure · ZITADEL authentication · no third-party data handlers

ONE DASHBOARD

One dashboard: sound, occupancy, environment.

What the floor manager sees on a Saturday (styled illustration — not a product screenshot):

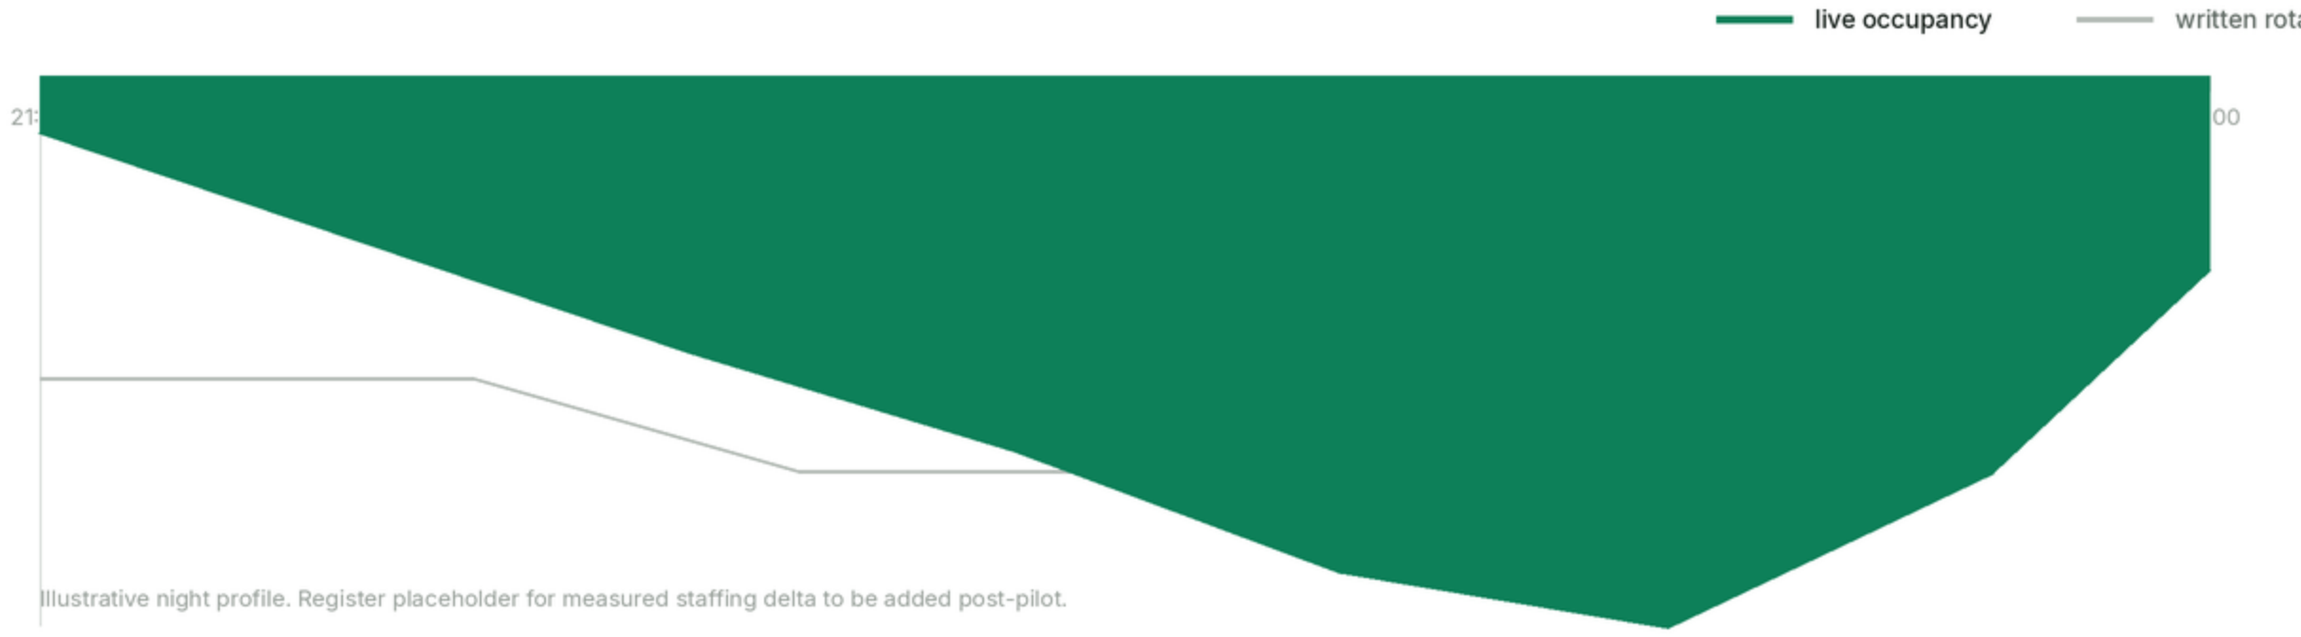

*TA Lärm night limit at the protected receptor (general residential), not inside the club — sourced fact, verify before external use.

VALUE — STAFFING

Staff follow the floor, not the schedule.

Live occupancy tells the floor manager when to pull the trigger on the second bar, the extra runner, the door.

Illustrative night profile. Register placeholder for measured staffing delta to be added post-pilot.

VALUE — COMPLIANCE

Compliance logs turn complaints into paperwork.

Continuous, timestamped dB(A) records at the sensor turn an existential dispute into an exportable record.

Night log — export

00:14	**64 dB(A)**
01:02	**71 dB(A)**
02:37	**58 dB(A)**

One click → PDF for authorities and insurers.

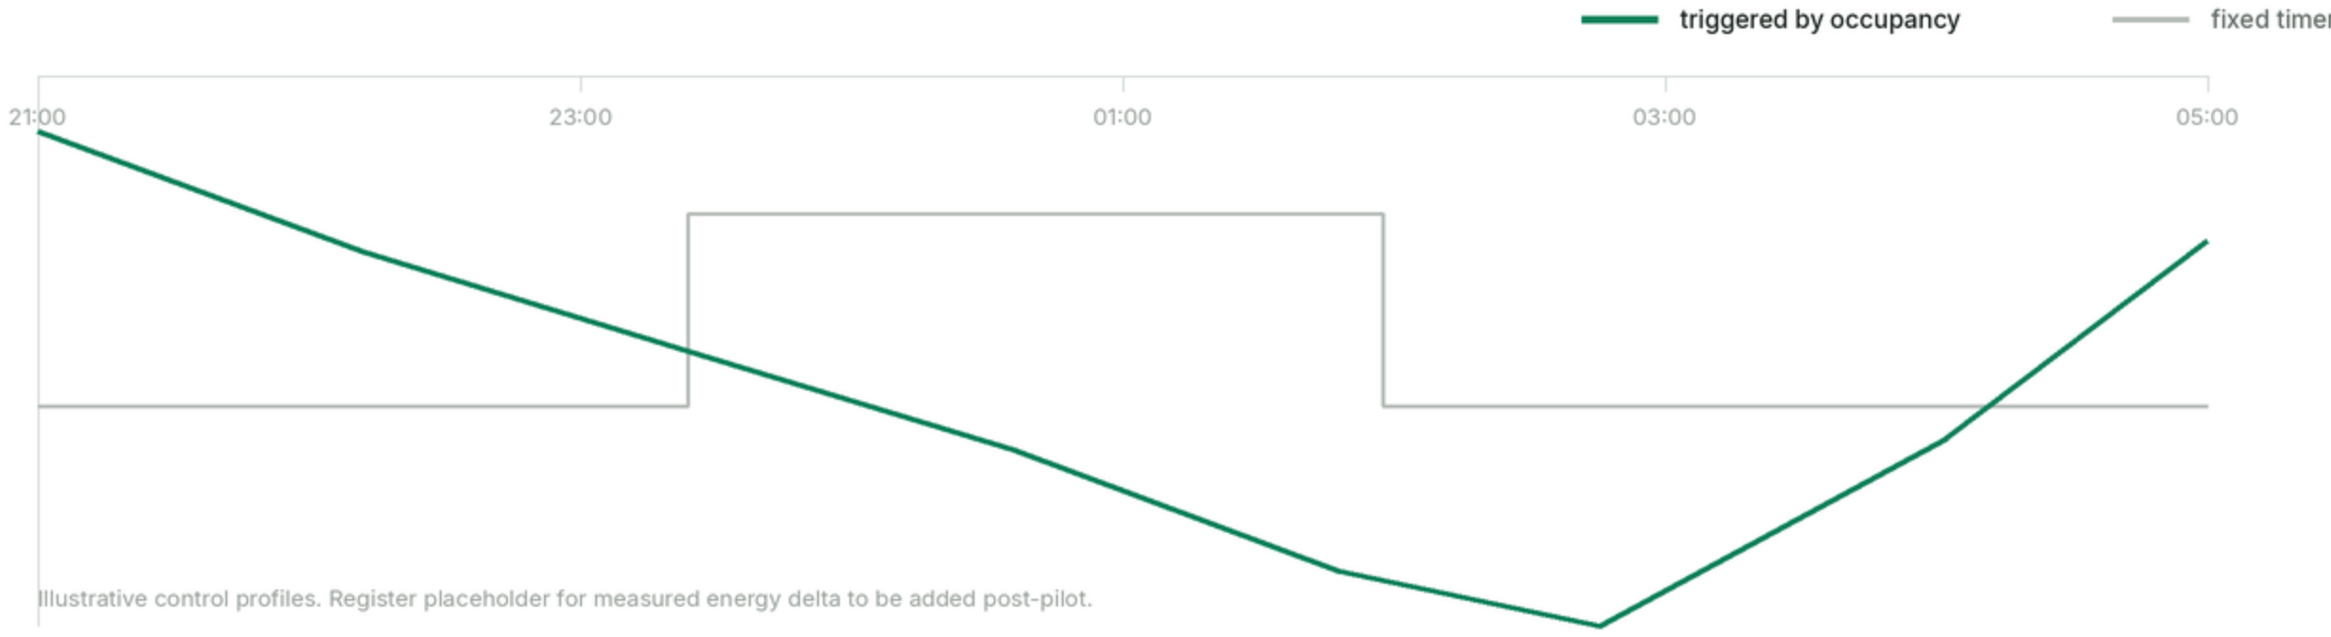

- TA Lärm assesses clubs as entertainment venues — limits apply at the protected receptor, not inside the club.
- Night immission limits commonly cited: 35–45 dB(A) depending on area category (general residential to urban core).
- Displacement risk is the documented closure path: resident complaints, arrival/departure noise, land-use conflict (LiveKomm Red List).

Sources: TA Lärm framework; LiveKomm via miz.org. Verify limits against the official table before external use.

VALUE — ENERGY

Ventilation follows people, not timers.

Occupancy-triggered extraction runs when the room is full — and rests when it is empty.

Illustrative control profiles. Register placeholder for measured energy delta to be added post-pilot.

TRACTION — 01

Five LOIs. Three pilots. 120 waitlisted.

Demand without a launch: no public product, no paid marketing.

sensors produced

All figures are placeholders from the metrics register — to be replaced with real values before investor use.

TRACTION — 02

Forty interviews shaped the sensor.

The product was specified by the people who will run it — then shipped end-to-end.

Hardware in-house: ESP32-S3, Rust firmware, in NixOS-managed production

Figures from the placeholder metrics register.

UNIT ECONOMICS — THE MONEY SLIDE

€149 a month. One bar shift covers it.

€149

per venue / month

software, all sensors, all dashboards

Hardware: €199 / sensor — a typical two-sensor install is €398, covered by the subscription in under three months.

Arithmetic on register values (€149/mo, €199/sensor) — labeled illustrative.

What €149 means to a venue (illustrative):

median venue turnover ≈ €20,000 / month · Clubins = 0.75% of it

Median turnover €240,000/yr (Initiative Musik Club Study, 2019). 0.75% is labeled arithmetic, not a company metric.

Pays for itself if it prevents one mis-staffed shift or one complaint escalation a month.

MARKET

32,455 German venues × €149 a month.

Bottom-up from official counts — no top-down 'huge market' claims.

32,455 venues

× €149 / month

× 12 months

≈ €58.0M / year

Labeled arithmetic ceiling at full penetration — a sizing reference, not a TAM claim.

Beachhead: live-music venues — noise exposure is existential

Never sum the Eurostat bars/pubs figure with the live-music study — the classifications overlap.

TEAM

Two builders who shipped the whole stack.

Sensor firmware, servers, dashboards and infrastructure — all in-house, all live.
