THE GOVERNING THOUGHT, STATED FIRST

The answer first: €500k proves per-venue measurement in ten venues.

Clubins gives venue staff live sound, occupancy and environmental data. This brief states its answer on page one, then earns it branch by branch: market, capability, economics.

All company figures are register-tracked placeholders; market figures are sourced. Spec: art_dEznXido.

SITUATION — THE WORLD AS IT IS

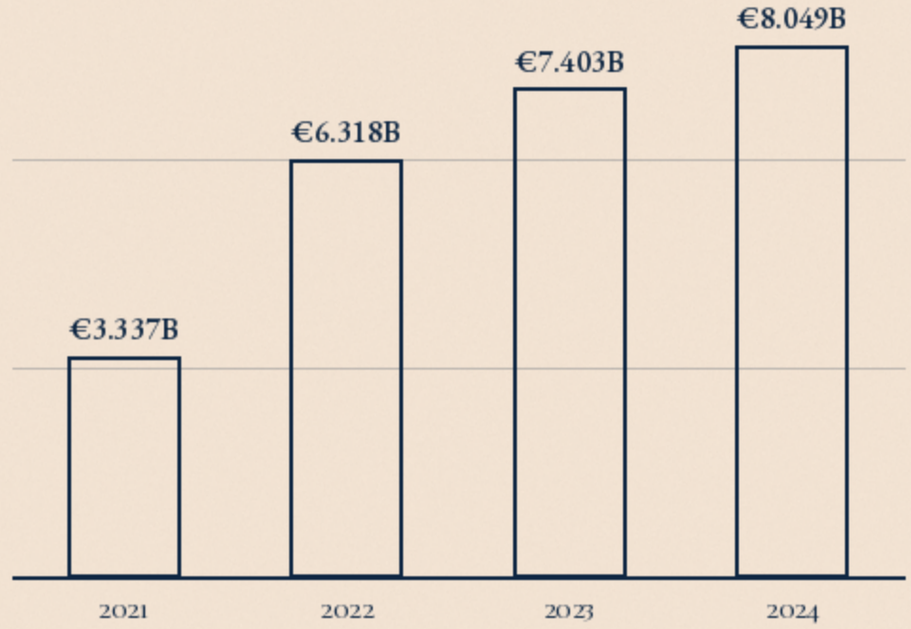

Situation: 32,455 German venues, none of them measured.

Germany counts 32,455 bars and pubs enterprises (Eurostat NACE I5630, 2024). Their net turnover reached €8.049 billion in 2024, recovering from €3.337 billion in 2021. Not one of them runs on measurement: sound, occupancy and conditions are still managed by instinct.

The count is official; the gap is operational. Decisions worth thousands are made nightly without a single instrument in the room.

NET TURNOVER, GERMAN BARS & PUBS

€ billions, Eurostat NACE I5630 (via Verified Market Size)

Source: Eurostat business statistics, NACE I5630, 2024, via Verified Market Size. Venue count is the S3 anchor (sourced).

COMPLICATION — WHY THE SITUATION CANNOT HOLD

Complication: margin pressure and enforcement are closing in.

MARGIN PRESSURE

Berlin clubs report 73% below pre-pandemic revenue, 20% fewer guests and 89% higher costs (Clubcommission Berlin, 2023 — Berlin survey). Sector-wide, the median venue turns €240,000 of turnover into €8,000 of profit (Initiative Musik Club Study, 2019).

Venues that run blind absorb both shocks at once — and noise-driven displacement (resident complaints, the LiveKomm "Red List") removes some from the market entirely.

ENFORCEMENT — TA LÄRM NIGHT LIMITS AT THE RECEPTOR

dB(A), night 22–06, at the protected location

Clubs are assessed as entertainment venues under TA Lärm; commonly cited night limits sit at 35–45 dB(A). The receptor hears the street, the door and the smoking area — none of which the venue can currently measure. Limits to be verified against official TA Lärm Table 1 before external use.

Sources: Clubcommission Berlin 2023 & Initiative Musik 2019 via miz.org; TA Lärm framework (commonly cited values). Noise framed as displacement risk — no national statistic claimed.

THE QUESTION — MINTO'S VERTICAL DIALOGUE

Can per-venue measurement economics work?

The reader has one open question after the complication. The Pyramid Principle says answer it in question–answer steps: every slide from here answers one sub-question, and every sub-question belongs to exactly one leg.

IS THE MARKET REAL?

Slide 6

CAN THIS TEAM SHIP?

Slide 7

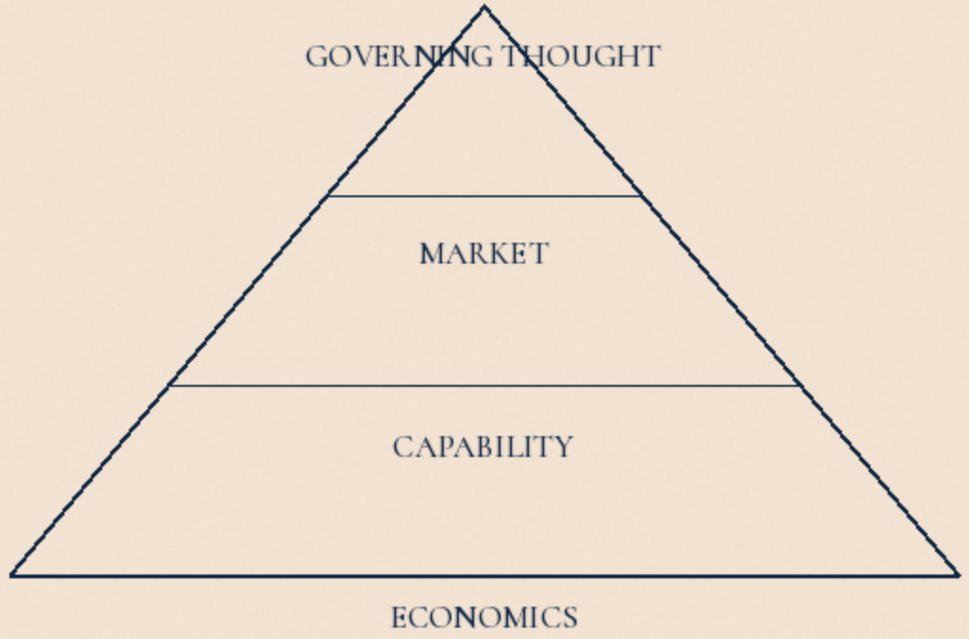

DOES THE PRICE WORK?

Slide 8

Framework: Barbara Minto, The Pyramid Principle (Pearson). Question answered on slides 5–11.

THE ANSWER — ONE GOVERNING THOUGHT, THREE MECE LEGS

The answer rests on three legs: market, capability, economics.

Mutually exclusive, collectively exhaustive: each later slide is one branch member, titled as its takeaway.

MARKET

32,455 venues × €149 a month — labeled arithmetic from the sourced count.

CAPABILITY

Two builders shipped the whole stack — 137 real commits.

ECONOMICS

€149 a month, €199 hardware on day one — register values.

RISKS

Named honestly, one branch of their own (slide 10).

Framework: Minto, The Pyramid Principle — answers supported by MECE grouped arguments.

BRANCH ONE — THE MARKET LEG

Market: 32,455 venues × €149 a month.

32,455 × €149 × 12 ≈ €58.0M

Potential annual revenue if every German bar and pub subscribed. This is labeled arithmetic on the sourced venue count and the register price — a ceiling for scale, not a forecast, and deliberately bottom-up rather than a top-down "huge market" claim.

100 VENUES BY END OF 2027

register target

€178,800 ARR AT 100 VENUES

same arithmetic, labeled

Beachhead: the ~2,000 German live-music venues (Initiative Musik, 2024/25) feel the displacement risk first — a distinct classification, never summed with the 32,455.

32,455 venues: Eurostat NACE I5630 2024 (sourced). €149: register (PLACEHOLDER). €58.0M and €178,800 are labeled arithmetic, not register metrics.

BRANCH TWO — THE CAPABILITY LEG

Capability: two builders shipped the whole stack.

137 *real commits — 92 + 45 from the git record*

THE TEAM

A team slide appears in 100% of successful seed decks (DocSend).

Patrick Haußmann

Munich — founder, product & platform

Swiftb0y

Berlin — engineering

THE STACK, BUILT IN-HOUSE

ESP32-S3 SENSORS — RUST FIRMWARE — GO INGESTION — CLICKHOUSE — FLUTTER APPS

Plus NixOS infrastructure and ZITADEL authentication — founded 2025 in Munich, two people, everything owned and no outsourcing. Firmware, Flutter and Go checks passed validation in October 2026.

137 commits = 92 + 45, counted from the project git record (real, not a placeholder). Team: per company truth. Founded 2025: register.

BRANCH THREE — THE ECONOMICS LEG

Economics: €149 a month, €199 hardware on day one.

€149

PER VENUE, PER MONTH

the register price, verbatim

€199

HARDWARE, DAY ONE

one sensor, sold at installation

80%

PILOT → PAID CONVERSION (PLACEHOLDER)

25

SENSORS PRODUCED SO FAR (PLACEHOLDER)

12

MONTHS OF RUNWAY ON THE ASK (PLACEHOLDER)

The hardware price is paid once, on day one; the subscription recurs. The legs meet here: the market leg sets how many venues, this leg sets what each is worth.

All figures on this slide are register values (art_VsrEzRTw, status PLACEHOLDER), used verbatim. No additional numbers invented.

THE LEGS, SUPPORTED

Traction supports the legs: 5 LOIs, 3 pilots, 120 waitlisted.

Not paying customers — the company is pre-launch and recruiting pilot venues (pilot@clubins.de). This is evidence of pull, measured in LOIs, committed pilots and waitlist, each mapped to a leg: market pull, capability to install, economics to convert.

All five figures are register values (PLACEHOLDER), used verbatim: 5, 3 (Q1 2027), 120, 40, 25.

AN HONEST BRANCH OF ITS OWN

Risks, named: what could break each leg.

IF THE MARKET LEG BREAKS

Venue margins are thin — the median venue keeps €8,000 of €240,000 turnover — so a €149 monthly line item needs visible payback. Churn, not market size, is the risk.

IF THE CAPABILITY LEG BREAKS

Two people carry the stack. The ask funds two engineering hires precisely because key-person risk is real until batch #2 ships through ten working pilots.

IF THE ECONOMICS LEG BREAKS

The 80% pilot-to-paid conversion is a placeholder assumption, and €199 hardware may not hold margin at 200-unit scale. Both break the model if real economics differ.

Naming the risks is the point of the method: a governing thought that survives its own counter-arguments is worth funding; one that hides from them is not.

Risk slide is its own honest branch (per brief). Median figures: Initiative Musik 2019 via miz.org. Conversion: register placeholder.

SO WHAT — THE GOVERNING THOUGHT, RESTATED

So what: the ask stands — €500k, ten venues, twelve months.

The answer first, kept where it was promised: €500k proves per-venue measurement economics in ten venues. The legs stand — market, capability, economics — and the risks are on the table with them.

USE OF FUNDS — REGISTER, VERBATIM

€500K	2	200	10	12
PRE-SEED, ON A SAFE	ENGINEERING HIRES	SENSORS — BATCH #2	PILOT VENUES	MONTHS OF RUNWAY

Milestone: 100 venues by end of 2027. Then the governing thought is no longer an argument — it is a measurement. Pilot venues: pilot@clubins.de.

Register values verbatim: €500k (SAFE), 2 hires, 200 sensors, 10 pilots, 12 months, 100 venues by 2027. Pre-launch — no paying customers claimed.
