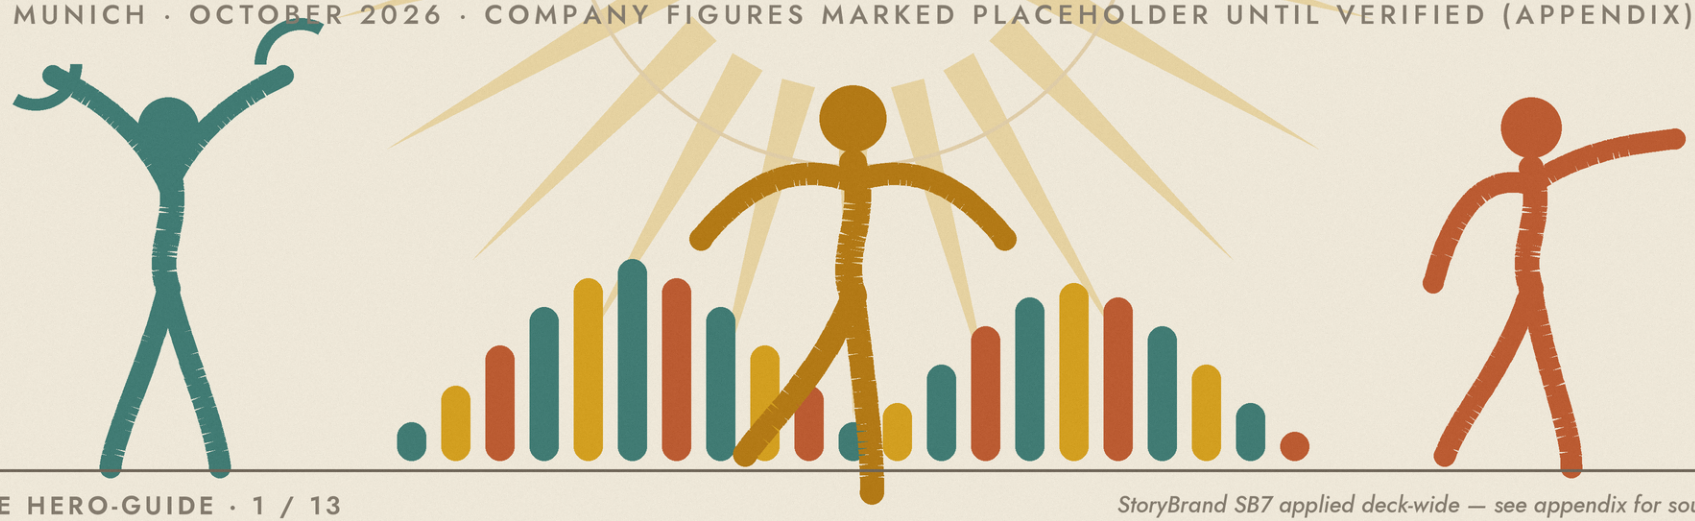
You are the hero.
We are the guide.

A plan for the person who runs the room: your sound, your occupancy, your air — measured live, decided in your favor.

MUNICH · OCTOBER 2026 · COMPANY FIGURES MARKED PLACEHOLDER UNTIL VERIFIED (APPENDIX)



StoryBrand SB7 applied deck-wide — see appendix for sources and the metrics register.

You run the thinnest-margin room in hospitality.

Your doors open at ten and the rent runs all month. You price the pour by feel and staff the night by instinct — and the median German live-music venue keeps about €8,000 profit a year on €240,000 of turnover. You deserve better math than that.

Every night you can't measure is a night you can't repeat — or defend.

You guess the count, you argue about the sound, you staff the dead hours anyway. After the worst nights there is nothing on paper — only stories. It keeps you up at 4 a.m., and it should: running a great room should not run on anecdotes.

THE NIGHTS NOBODY WROTE DOWN

73%
OF BERLIN CLUBS BELOW PRE-PANDEMIC REVENUE

SOURCE

89%
OF BERLIN CLUBS FACING HIGHER COSTS

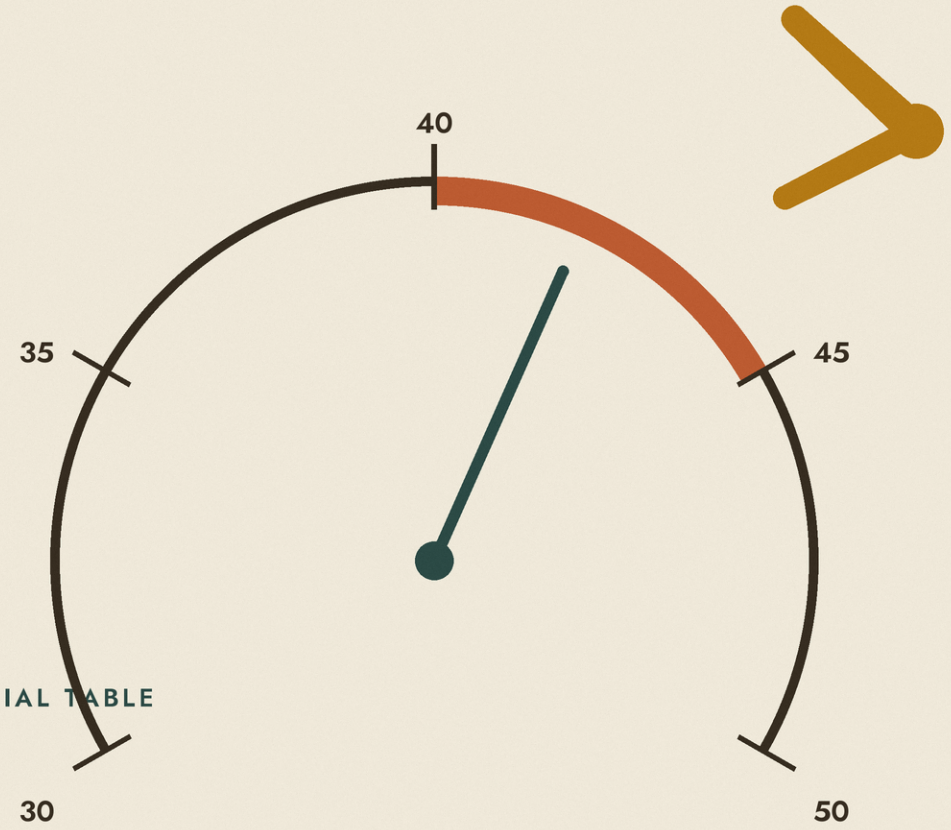
SOURCE

Sourced: Clubcommission Berlin survey via miz.org (2023) — Berlin-specific, not national. No placeholder figures on this slide.

Your license is defended with numbers you don't currently keep.

When a complaint lands, the argument is decided on the neighbour's notebook, not your records. German noise rules (TA Lärm) put the commonly cited night limits at the neighbour's wall — 40 dB(A) in general residential streets, 45 dB(A) in mixed urban cores — and venue groups track displacement conflicts on LiveKomm's 'Red List'. You cannot argue what you never wrote down.

LIMITS APPLY AT THE RECEPTOR, NOT INSIDE THE CLUB — VERIFY AGAINST THE OFFICIAL TABLE



COMMONLY CITED TA LÄRM NIGHT LIMITS AT THE NEIGHBOUR'S WALL, dB(A)

Sources: TA Lärm commonly cited limits (verify against official Table 1 before external use); LiveKomm 'Red List' via miz.org — displacement risk, never a national statistic.

We are the guide: we have done the listening your nights demand.

We have stood in your back office. We know the 2 a.m. walk-through, the manager's gut, the silent spreadsheet. And we bring the instrument your room was missing.

THE GUIDE SHOWS THE INSTRUMENT — YOU HOLD IT

All four figures are PLACEHOLDERS from the metrics register (16 rows) — Patrick swaps real values at close.

Your plan to a measured venue is three moves.

1

HANG

You mount palm-size sensors. No construction work — one afternoon and you are instrumented.

2

WATCH

Your rooms stream sound, occupancy, and air — live, on the screens you already carry.

3

ACT

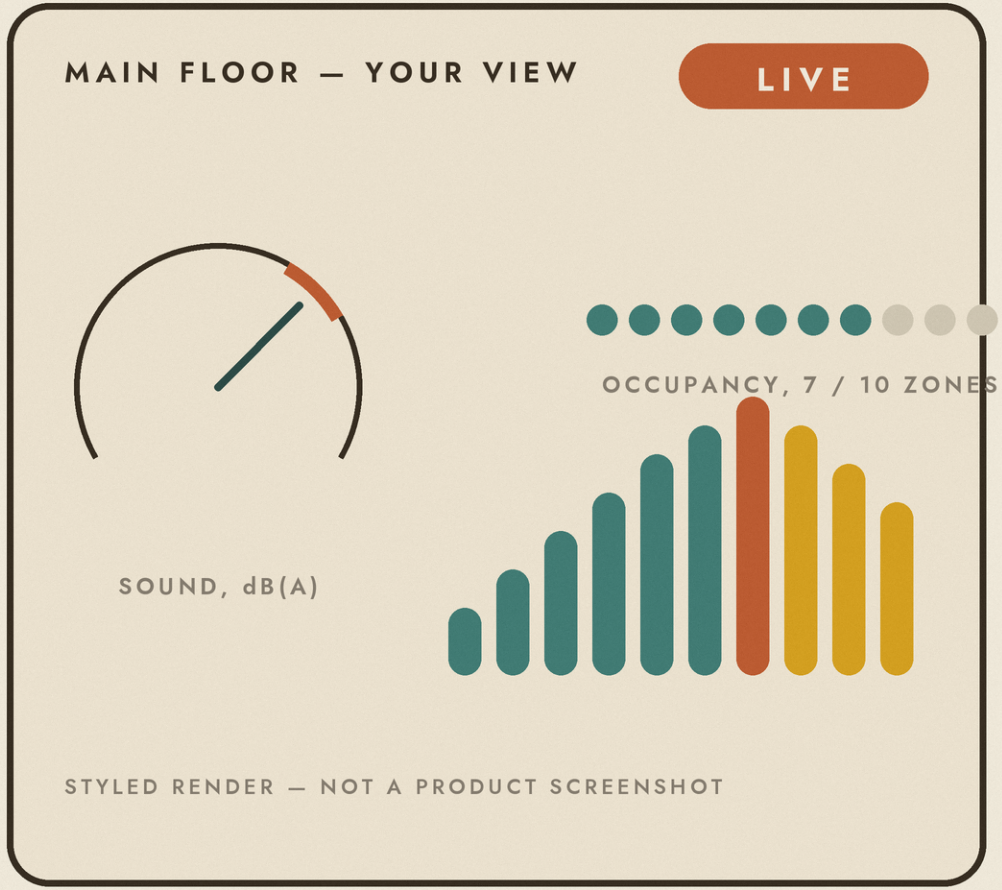
You decide on evidence, not memory: staffing, sound, and spend — in your favor.

SB7 plan: three simple moves in the operator's hands — the verbs are yours.

You watch every room live — from the office, the bar, or your sofa.

Sound, occupancy, and environmental conditions stream to web, Android, and iOS dashboards. You set your limits; the guide warns you before you cross them. The hardware is real and running.

25 SENSORS PRODUCED — PLACEHOLDER

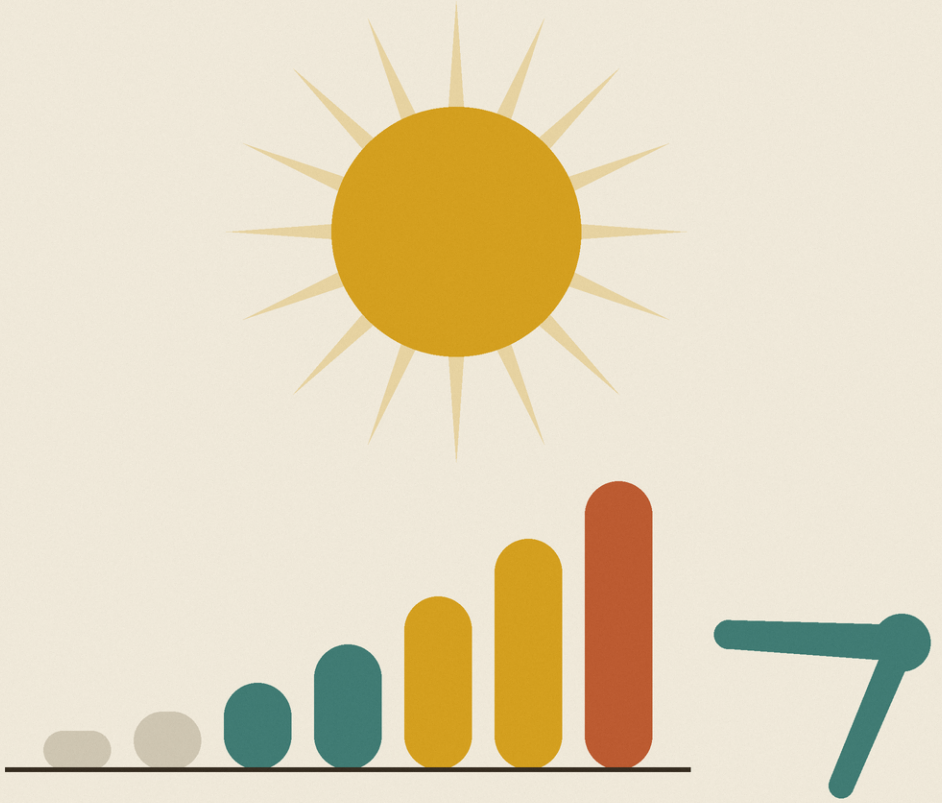


Product truth: ESP32-S3 sensors, Go ingestion, ClickHouse, Flutter dashboards (clubins-hack README). '25 sensors produced' is a PLACEHOLDER.

You will see the crowd building before the queue does.

Nights have a shape. Once you can see it, you staff to the curve, time the happy hour, and catch the crush while it is still a choice. The dead hour and the peak stop being surprises.

That is what your night looks like when someone finally writes it down for you.



YOUR NIGHT, WRITTEN DOWN

The plan's payoff in your voice: the shape of the night, visible before it happens.

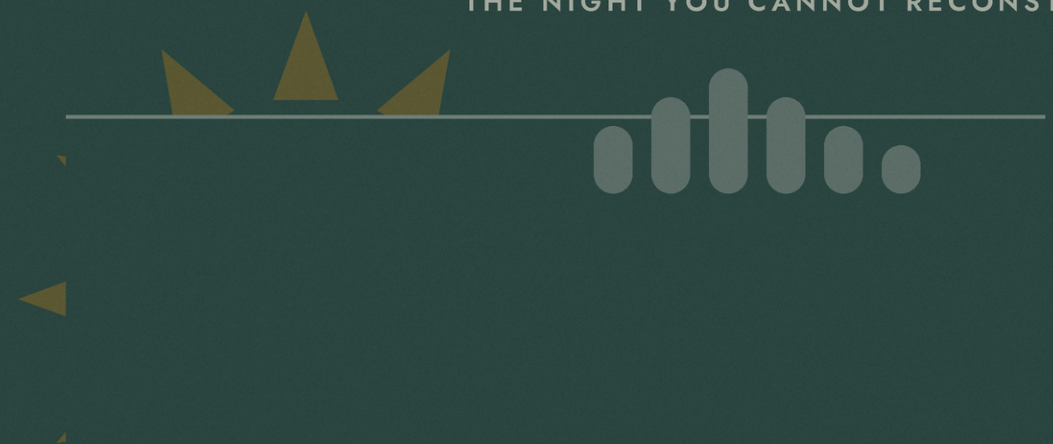
THE FAILURE YOU AVOID

You avoid the unmeasured night that sinks other venues.

The complaint with no records. The staff rota built on a dead hour nobody saw. The license hearing argued from anecdotes. That is the unmeasured night — and you will not be the operator explaining a story they cannot reconstruct.

NO INVENTED STATISTICS — THE FAILURE IS THE STORY ITSELF

THE NIGHT YOU CANNOT RECONSTRUCT



SB7 failure beat. Framing follows the honesty rule: displacement risk is documented, never national.

THE SUCCESS YOU WIN

You win the morning after: full room, calm staff, clean report.

The night wrote its own record while you worked it. You show the numbers to staff, accountant, and neighbour alike — one version of the truth, and it is yours. The venues already waiting for this instrument number 120.

120 WAITLIST VENUES — PLACEHOLDER

SB7 success beat. '120 waitlist venues' is a PLACEHOLDER from the register.

You keep the plan for €149 a month — and 8 in 10 pilot venues do too.

One price covers the guide, the instrument, and the nightly record. Pilots convert to paid at 8 in 10; the next ten pilots install within six months of the raise.

PLACEHOLDER

External tailwind (commercial estimates, labeled): commercial-building sensor markets compounding at roughly 8.5 to 13.5 percent a year into the 2030s.

Placeholders per register: €149/mo, €199/sensor, 80% conversion, 10 pilots. Market CAGRs: DataIntelo 8.5%, IndexBox 13.5% — commercial estimates, different definitions, never summed.

Book your first measured month — and fund the guide behind it.

FOR YOU — THE OPERATOR

Write to pilot@clubins.de. You install in an afternoon and join the first three venues installing in Q1 2027. Never guess a night again.

PILOT@CLUBINS.DE

3 PILOT VENUES, Q1 2027 — PLACEHOLDER

FOR THE GUIDE'S NEXT CHAPTER

€500k pre-seed (SAFE) — 12 months runway.

Use of funds: 2 engineering hires, sensor batch #2 (200 units), 10 pilot venues.

Toward 100 venues by the end of 2027.

ASK, RUNWAY, TARGETS — ALL PLACEHOLDER

SB7 call to action: direct (book the pilot) and transitional (the €500k SAFE). Every figure is a PLACEHOLDER per the register.

APPENDIX — EVIDENCE DISCIPLINE

Every company number here is a placeholder; every market claim is sourced.

COMPANY FIGURES — PLACEHOLDER METRICS REGISTER (16 ROWS)

All invented values — 40 venue interviews, 5 design-partner LOIs, 3 pilots installing Q1 2027, 120 waitlist venues, 25 sensors produced, 80% pilot-to-paid, €149 per venue per month, €199 per sensor, €500k pre-seed ask, 12-month runway, 2 engineering hires, 200-unit sensor batch, 10-pilot target, 100 venues by end of 2027, team of 2, founded 2025 — exist for format review only. Patrick swaps real values at close. Each register row carries this deck's mark: V20 the-hero-guide.

MARKET & REGULATION — SOURCED, QUALIFIED

32,455 bars & pubs and €8.05B turnover (Eurostat NACE I5630, 2024). Median venue €240k turnover / €8k profit (Initiative Musik Club Study via miz.org, 2019, pre-pandemic). Berlin: 73% below pre-pandemic revenue, 20% fewer guests, 89% higher costs (Clubcommission survey, 2023). TA Lärm: commonly cited night limits of 40/45 dB(A) at the receptor — verify against the official table. Noise framed as documented displacement risk (LiveKomm 'Red List'), never a national statistic. Sensor-market CAGRs are commercial estimates (DataIntelo, IndexBox) — different definitions, never summed.

Product truth: Clubins gives venue staff live visibility of sound levels, occupancy, and environmental conditions in bars and clubs — pre-launch, recruiting pilot venues. No public launch, no paying customers claimed.

Doctrinal framework cited in this slide's speaker notes (PPTX), not on slides.
