THE RISK

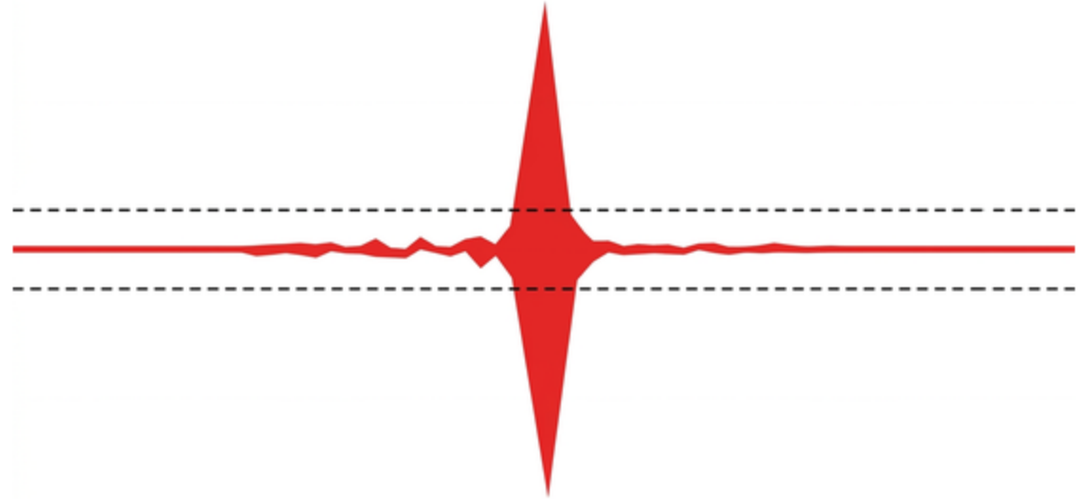

85 dB(A) can end your business.

A club night runs well above 85 dB(A) inside. At night, the limit at a residential wall is 35–45 dB(A) (TA Lärm, commonly cited values). Today that gap is managed by guesswork.

One complaint.

One fine.

One closure.

Displacement is documented, not hypothetical: LiveKomm's "Red List" tracks venues lost to resident noise conflict — 20 of its 21 listed venues sit in large cities (LiveKomm via miz.org, undated).

The rules are tightening, not loosening.

TA LÄRM — NIGHT IMMISSION LIMITS AT THE PROTECTED RECEPTOR (THE NEIGHBOUR'S WALL)

AREA	DAY 06–22	NIGHT 22–06
Pure residential	50	**35** dB(A)
General residential	55	**40** dB(A)
Urban or mixed core	60	**45** dB(A)

Commonly cited values — verify against official TA Lärm Table 1 for the specific site.
Night = 22:00–06:00. Sperrzeit (closing hours) is set by state and municipal rules, not nationally.

Continuous measurement beats a guy with an app.

SPOT CHECK

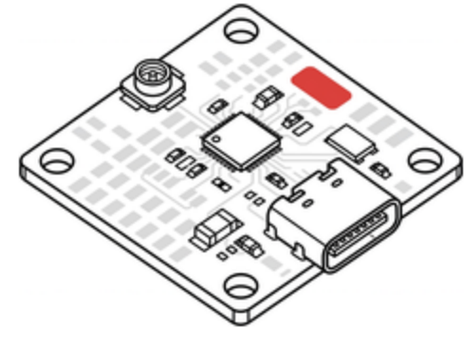

When someone remembers

One room, one moment

No record, no defence

CONTINUOUS

- Every minute, every zone
- Logged history
- Evidence on file

Clubins: ESP32-S3 sensors, Rust firmware, live dashboards — the measurement never leaves the wall.

One screen answers: are we safe tonight?

- Sound level vs. the limit
- Occupancy, live
- Temperature & humidity

Styled render of the Clubins dashboard — live sound, occupancy and environment for venue staff. (Illustration, not a product screenshot.)

Venues are fighting for margin they cannot see.

73%

of Berlin clubs are below pre-pandemic revenue
