CLOUD PHYSICS FOR THE PHYSICAL NIGHT

every claim is one metric: definition -> formula -> value -> status

11 slides / 16 register rows / zero vibes-based numbers

Patrick Haußmann (Munich) · Swiftb0y (Berlin) · pilot@clubins.de

metric: MRR per venue = EUR 149. definition first.

METRIC_ID : MRR_PER_VENUE
def : recurring subscription revenue collected per venue, per month
formula : sum(monthly venue subscription fees) / active paying venues
value : EUR 149 / venue / month
status : PLACEHOLDER — Patrick swaps the real value before investor use
src row : 'Price per venue' — Placeholder Metrics Register art_VsrEzRTw

why definition first (Bessemer metrics discipline):

a revenue number without a definition is not a metric, it is a mood.
EUR 149 here means ONE venue, one subscription, FULL month — the per-venue subscription Clubins charges venues directly. hardware is NOT in it.
[hardware pricing -> next slide]

recurring line (per venue):

metric: hardware = EUR 199 one-time, day one.

METRIC_ID : HW_PRICE_PER_SENSOR
def : one-time price per sensor unit, invoiced at installation
formula : n/a — single unit price (no recurring component)
value : EUR 199 / sensor
status : PLACEHOLDER — register row 'Hardware price'
src row : Placeholder Metrics Register art_VsrEzRTw

why day one matters:
the venue's first invoice is EUR 199 + EUR 149 — hardware up front,
software every month after. two revenue lines, two behaviors.

cash shape (per new venue):

hardware built to date: 25 sensors (register) · batch #2 = 200 units, funded by the ask
[revenue quality of this hardware line -> payback, slide 4]

metric: payback period — labeled arithmetic, register values only.

METRIC_ID : PAYBACK_PERIOD (HARDWARE, ILLUSTRATIVE)
def : months of software revenue that recover one sensor's price
formula : hardware price / software price per month

EUR 199 / EUR 149 per month = 1.34 months

status : ILLUSTRATIVE — arithmetic on two register values ('Price per venue', 'Hardware price'); no new numbers introduced.

what this number is NOT
- it is not a CAC payback — customer-acquisition cost is not in the register, so it is excluded (not assumed)
- it is not margin-adjusted — hardware COGS is unmeasured (risk 04)
- the true payback will be LONGER than 1.34 months

why we still show it: the EUR 149/month subscription repays the sensor's EUR 199 price tag in month two of the venue's life (EUR 149 x 1.34 = EUR 199) — every month after that is software economics.

metric: gross margin structure — two lines, one honest gap.

METRIC_ID : GROSS_MARGIN_SPLIT
def : revenue lines with different cost structures, stated separately

line 1 software : EUR 149 / venue / month ..... margin: NOT YET MEASURED
(costs: hosting, ingestion, dashboards — no COGS figure in register)
line 2 hardware : EUR 199 / sensor one-time ..... margin: NOT YET MEASURED
(costs: PCB, assembly, shipping — no COGS figure in register)

status : STRUCTURE ONLY — no gross-margin percentage exists in the register.
Labeled illustrative; we will not dress a guess as a metric.

structure we CAN stand behind (pre-seed logic):

- software is the compounding line: same stack serves venue 1 and venue 100
- hardware is the seeding line: sold at day one, funds its own batch (slide 10)
- Bessemer discipline says state the split BEFORE quoting a blended % —
  a blended margin on an unmeasured mix is the number startups hide behind

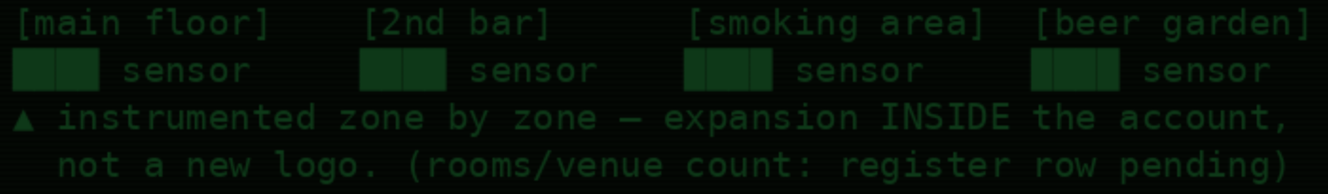

[gap: both COGS lines land in the risk log, slide 9. first measured
margins are a named use of the pilot phase, not a slide-5 promise.]

metric: expansion — one venue, many rooms. value: GAP.

METRIC_ID : EXPANSION_PER_VENUE
value : NOT IN REGISTER — declared gap, no placeholder invented
status : MECHANISM PRESENTED WITHOUT A NUMBER (per brief)

the mechanism (why expansion exists structurally):

a venue is not one room. it is a main floor, a second bar, a smoking area, a beer garden. each monitored zone takes its own sensors; the venue pays per venue today — but occupancy coverage per zone is the natural expansion axis: more zones instrumented -> more of the venue's Saturday runs on Clubins -> the account grows inside itself.

▲ instrumented zone by zone — expansion INSIDE the account, not a new logo. (rooms/venue count: register row pending)

honesty rule applied: retention and expansion numbers get quoted only after pilots observe them (see risk 05). not before.

funnel: 5 LOIs, 3 pilots, 120 waitlisted — all register rows.

METRIC_ID : FUNNEL — five register rows, verbatim

40 interviews	venue interviews conducted
5 LOIs	design-partner LOIs signed
25 units	sensors produced
3 venues	pilot venues installing (Q1 2027)
120 venues	waitlist venues

status : ALL VALUES PLACEHOLDER (register rows verbatim: 5 / 3 / 120 / 40 / 25)
conversion: pilot->paid assumed 80% — a PLACEHOLDER assumption, not observed
(it appears here as assumption and in the risk log, never as fact)

reading the funnel: 40 interviews preceded the product. 5 LOIs say venues will sign. 3 installs in Q1 2027 say venues will run it. 120 waitlist venues say the pull is wider than the pilot cohort.

market: 32,455 venues x EUR 149 — bottom-up, labeled arithmetic.

METRIC_ID : TAM_BOTTOM_UP
input 1 : 32,455 bars & pubs enterprises, Germany (Eurostat NACE I5630, 2024 — sourced count, Market & Regulation Facts doc)
input 2 : EUR 149 / venue / month (register price)

32,455 x EUR 149 = EUR 4,835,795 / month ~= EUR 58.0M / year

status : SOURCED COUNT x REGISTER PRICE — labeled arithmetic, not a forecast and not a penetration claim.

context lines (all sourced, all labeled)
- DE bars & pubs net turnover: EUR 8.049B (Eurostat NACE I5630, 2024) — sector size, not our TAM
- ~2,000 live-music venues (Initiative Musik club study 2024/25) — the loudest, highest-stakes subset
- the two figures are NOT summed — classifications overlap

beachhead logic: ~2,000 live-music venues feel the sound/land-use conflict first; the 32,455-venue count is the ceiling, not the plan.
target: 100 venues by end of 2027 (register) = 0.3% of all venues, 5% of live-music venues — labeled arithmetic on the sourced counts.

risk log: what we do not know yet.

METRIC_ID : RISK_LOG — the register's empty cells, declared

[RISK-01] no verified nationwide figure for venues facing noise complaints — noise is framed as documented displacement risk (LiveKomm Red List), never a statistic

[RISK-02] pilot->paid conversion (80%) is a placeholder ASSUMPTION, not an observation; first pilots have not run long enough to observe conversion

[RISK-03] CAC is not in the register — the 1.34-month payback (slide 4) excludes it; true payback is longer by exactly the amount we cannot yet measure

[RISK-04] hardware and software COGS unmeasured — gross margin is structure, not % (slide 5); first measured margins are a pilot-phase deliverable

[RISK-05] expansion revenue per venue: no register value (slide 6) — retention quoted only after pilots observe it

[RISK-06] TA Laerm limits and Sperrzeit are receptor- and jurisdiction-specific; we quote the framework, never a fake national closing time

an investor deck that hides its empty cells is asking you to fund the hiding.
these six get closed in order: 02/05 by pilot observation, 03/04 by pilot economics.

ask: EUR 500k pre-seed (SAFE), mapped to metrics.

METRIC_ID : RAISE
amount : EUR 500,000 pre-seed on a SAFE
runway : 12 months (register)

use of funds — every line is a register row:

 **2 engineering hires**

register: Engineering hires planned = 2

 **sensor batch #2: 200 units**

register: Sensor batch 2 = 200 units

 **10 pilot venues installing**

register: Pilot target = 10 venues (6 months post-raise)

what the money buys in 12 months (milestones, register rows):

- 10 pilot venues running on instrumented zones (6 months post-raise)
- 25 -> 225 sensors built (25 produced + batch #2 of 200)
- trajectory: 100 venues by end of 2027 (register 'Venue target 2027')

what the money does NOT buy: a growth story we cannot instrument.
every milestone above is countable on a dashboard — that is the point.

```
$ clubins --metrics --honest   # run complete
closing registry ..... 16/16 rows traced
unlabeled numbers ..... 0
invented statistics .... 0
```

$ echo $?

0

the deck is the product argument.
a company that monitors venues in real time should be able to state its own numbers with definitions, formulas, values, and status — every claim on these 11 slides is one register row or one labeled arithmetic step.
cloud physics for the physical night: measure first, then scale.

Patrick Haußmann — founder, product & platform (Munich)
Swiftb0y — engineering (Berlin)
pilot@clubins.de — 3 pilot venues installing Q1 2027 · 120 waitlisted
